- ***Understanding the Impact of Per-Capita GDP on Infant Mortality Rate: A Panel Analysis of G-20 Countries***

*The primary goal of the current study is to estimate, using the G-20 countries as a reference, the effect of per-capita gross domestic product (PGDP) on infant mortality rate (IMR). Estimating a two-way fixed effects model using yearly data on IMR and PGDP for the G-20 from 2000 to 21 sourced from the World Bank database, the study finds that as the nation becomes more prosperous and powerful, IMR decreased, which is consistent with the findings of Erdogan et al. (2013). A major factor in the growth of economic power and the reduction of IMR of the countries was the development of new levels of strategic thinking that would result in innovative solutions. (Published in **The Econverse: a student led initiative**, School of Economics, University of Hyderabad)*
